Enclosed, Automated Chip Disposal System Eliminates Indirect Labor, Improves Plant Safety

April 26, 2006 Cincinnati, OH – With over 100 systems now in operation, the Turbo 3-D Disc Conveyor from LNS America, Inc. is a proven solution for handling machine chips and other challenging materials. The fully enclosed conveyor uses an endless chain and attached blades to pull waste materials through a sealed piping system to a disposal hopper. Cutting fluids or other liquids may be recovered at various points within the system. This design eliminates the need for multiple chip hoppers, drums or other storage devices as well as the machinery and labor required to move the materials to a disposal site. The results are a cleaner, more attractive, safer workplace; reduced labor costs and less machine downtime from backed up chip hoppers.

Flexibility is also built into the 3-D system, as it can be installed above or below grade and under, over or around machinery and other obstacles. The simple, rugged design means less maintenance, and the system can be easily reconfigured or relocated to accommodate equipment or process changes.
